

Que-4 : List out any 3 tags we learned in this module and give a brief explanation about the tags.

Heading tags : These tags are used to markup various heading levels on the webpage. Heading levels in HTML are from h1 to h6, h1 being the largest and h6 the smallest heading level. Other heading levels are also syntactically correct in HTML but they are treated exactly the same as <p> tag.

Example : <h1> This is Level 1 heading. </h1>

Paragraph tag : Paragraph (<p> </p>) tag is used to demonstrate paragraph or Written contents in a webpage. It is a block level tag.

Example : <p> This a paragraph written in HTML. </p>

Line break :
 tag is known as the line break element in html and it breaks the line, that is, the content written after applying
 tag will be displayed from the new line in the browser. This tag is a self-closing tag which means it does not require a closing tag.

Example : HELLO !

 I am going to be a great developer soon.
