

**Que-10 : What are global attributes? List any 5 global attributes.**

Global attributes are the attributes that can be applied easily on almost all of the HTML elements. These are common in all HTML tags. Some of the common Attributes are :

1. **lang** : It is used to specify the language of the element content. Some examples of languages are en for English, es for Spanish, etc.
2. **id** : It is a unique identifier that is used to specify the document and used by CSS and JavaScript to perform a certain task for a unique element.
3. **style** : Style in HTML are basically rules that describe how a document will be presented in a browser.
4. **title** : It is used to define the title of an HTML document, sets the title in the browser toolbar, and provides the title for the web page when it is added to favorites.
5. **class** : Used to specify one or more classes for an element, which can be used for styling with Internal or External CSS
